# Why Are Codecs a Call Quality Issue with International VoIP Networks?

[1 / 2]

- ▶ TDM networks designed for 64kbit/s speech
  - ▶ G.711 codec universally used in fixed networks
  - ▶ Mobile networks - G.711 is interconnection standard

- ▶ For inter-continental international networks, “voice compression” often used:
  - ▶ DCME transcoded to a lower bit rate codec and suppressed transmission of silence
  - ▶ Average voice transmission rates achieved
    - ▶ 16kbit/s (G.726 codec)
    - ▶ 8kbit/s (G.728 codec).
  - ▶ Always the switch interface was G.711 64kbit/s

international ip interconnection

i<sup>3</sup> forum

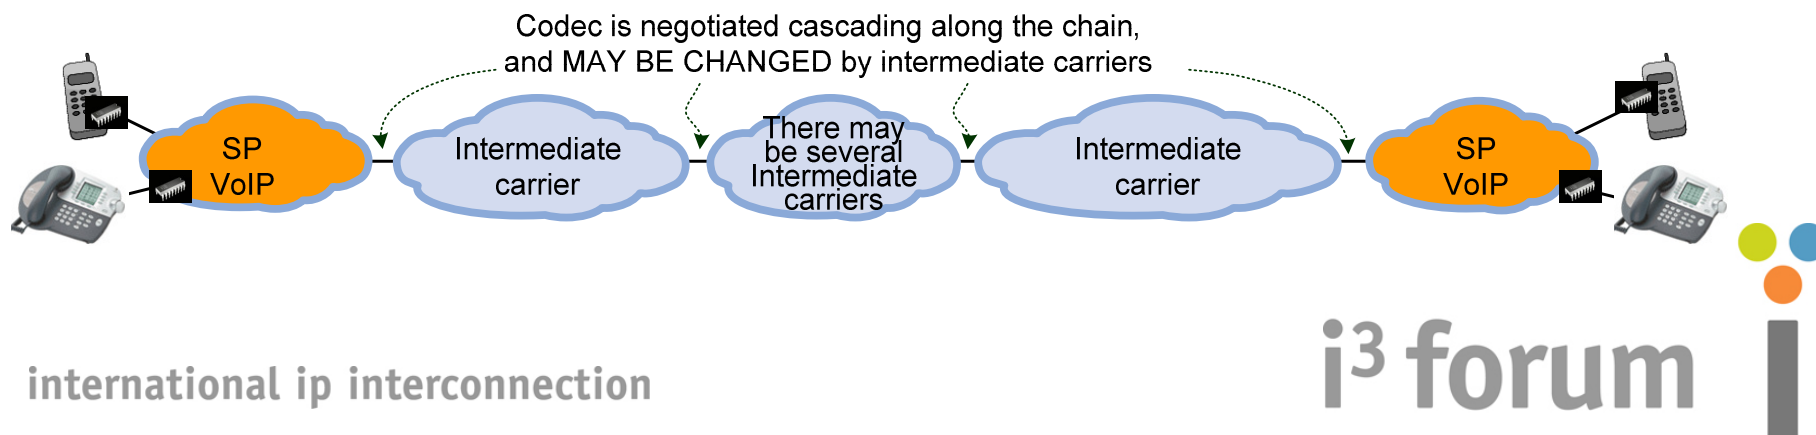

# Why Are Codecs a Call Quality Issue with International VoIP Networks?

- ▶ VoIP has no common codec standard,
  - ▶ more codecs now available,
  - ▶ more being invented
- ▶ Codecs remain the primary responsibility of Service Providers
- ▶ Due to diversity of networks and codec choices in the World,
  - ▶ transcoding will occur on international calls
  - ▶ voice quality will be impacted
- ▶ codec is part of the call set-up negotiation

# The Problem of Many Codecs

- ▶ Voice Engineering
  - ▶ Intermediate (usually international) carriers
    - ▶ may not have visibility of the end SP's
    - ▶ visibility is of the ingress and egress carriers networks only
    - ▶ may not know if transcoding has already occurred,
  - ▶ International carriers are the greatest affected by codecs (and IP transmission latency) but have little control over these design variables

# End - to - End View is Required

- ▶ End – to – End, NOT Local
  - ▶ lowering voice bit rate within a carrier network to save bandwidth looks attractive
  - ▶ This is WRONG EMPHASIS, leads to
    - ▶ lost \$\$\$ because of customers disliking lower call quality
    - ▶ damages carriers reputation
  - ▶ End-to-end (meaning ear–to–mouth) approach must be taken
    - ▶ This includes cordless phone codecs!

## Economic Impact of Poor Call Quality

- ▶ A good (natural) voice call means customers linger and just talk.
- ▶ Low voice quality means customers hang up early (revenue lost)
  - ▶ may “sink” deals won on basis of high quality parameters
  - ▶ loss of customers to competitors
  - ▶ extra load on call centres

Main Impact

MOSCQE (See later slide)	R-Factor (see later slide)	% of customers terminating call early	Loss on 3B minutes pa @ 1c/min margin, assuming ALOC is halved for customers terminating early
3.74	73	1%	\$150,000
3.6	70	1.7%	\$255,000
3.1	60	6%	\$900,000
2.58	50	18%	\$2,700,000

Simple impact of customers hanging up early

# Codec Types and Call Quality

- ▶ Narrow band codecs (speech 300Hz – 3.4KHz)
  - ▶ PSTN standard bandwidth
  - ▶ low tolerance to transcoding and latency
- ▶ Wideband codecs (speech 50Hz – 7KHz)
  - ▶ improve speech quality
  - ▶ higher tolerance to transcoding
  - ▶ offsets the problems with NB
  - ▶ BUT new, and will take time to evolve into ALL networks
- ▶ LBR codecs (Low Bit Rate Narrow Band codecs)
  - ▶ required when low transmission rates are necessary because bandwidth is scarce or expensive,
  - ▶ lowest tolerance to transcoding and latency

# Standard Framework for Call Quality Planning – Voice Quality Measurement

- ▶ Measuring Voice Call Quality
  - ▶ ask people to classify calls to a MOS scale (Mean Opinion Score).
- ▶ MOS is
  - ▶ a customer choice,
  - ▶ its what customers actually think,
  - ▶ is the absolute reference.

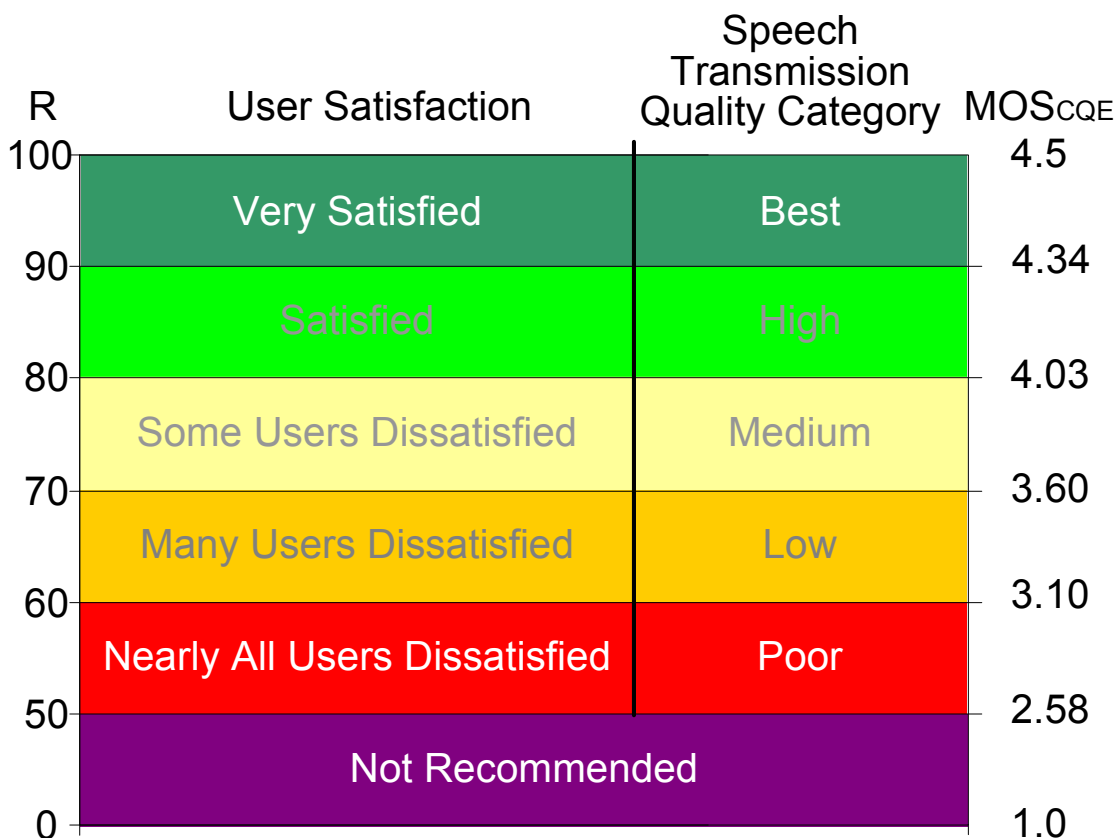

<b>MOS</b>	<b>Classification</b>
<b>5</b>	<b>Excellent</b>
<b>4</b>	<b>Good</b>
<b>3</b>	<b>Fair</b>
<b>2</b>	<b>Poor</b>
<b>1</b>	<b>Bad</b>

Scale of MOS values.

# Standard Framework for Call Quality Planning – A Narrow Band Voice Quality Planning Tool

- ▶ Voice Quality predicted using an ITU-T developed E-Model
- ▶ E-model output is
  - ▶ R-Factor
  - ▶ used to predict MOS scores (called  $MOS_{CQEQ}$ )
- ▶ R-Factor calibrated in Voice Quality Bands (although Quality Scale is a continuum)

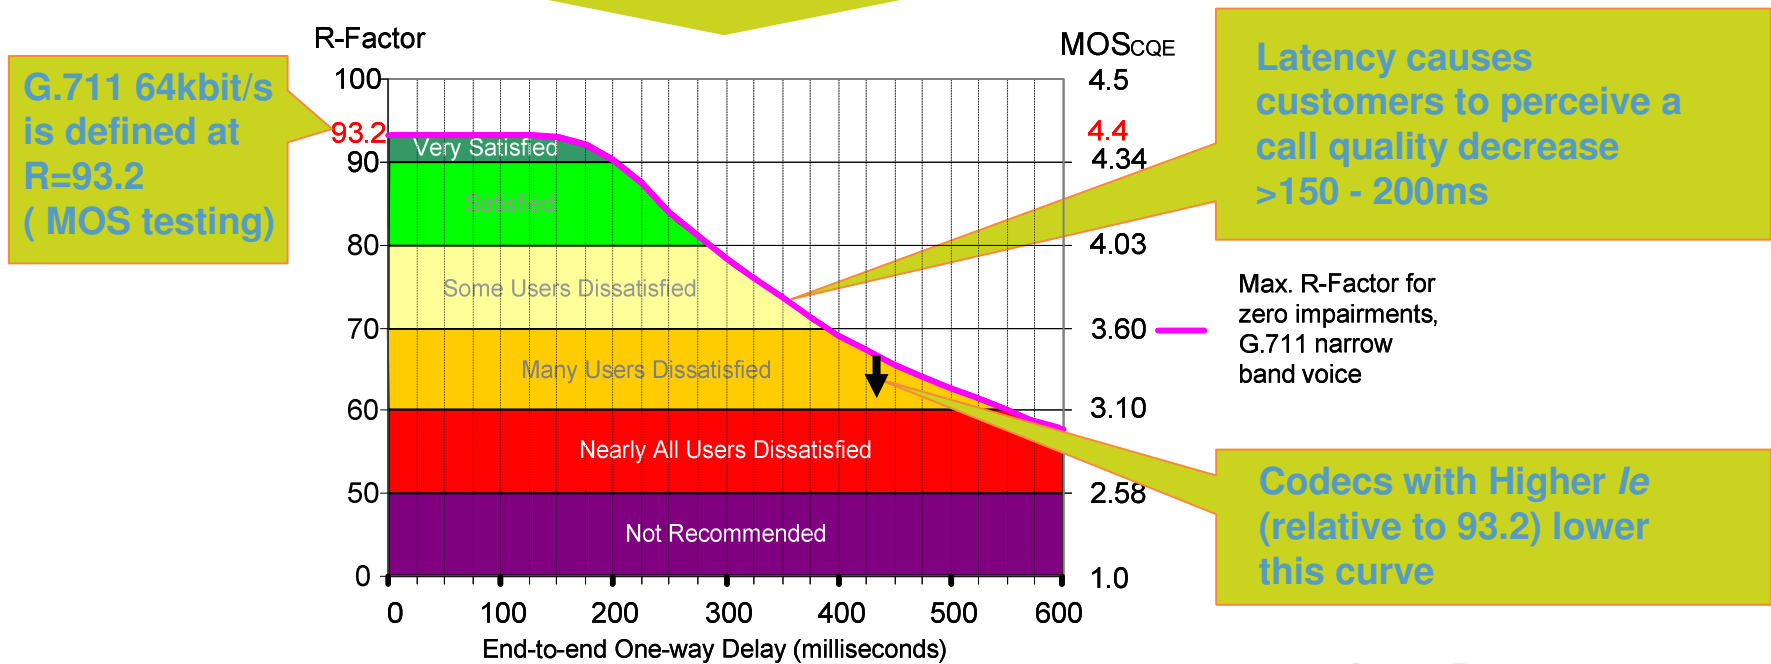

# Standard Framework for Call Quality Planning – A Narrow Band Voice Quality Planning Tool

[2 / 2]

- ▶ E-Model:  $R\text{-factor} = R_o - I_s - I_d - I_e + A$   
 Impairments due to: Noise (Loudness, sidetone, echo etc), Delay, Codecs, Advantage Factor

- ▶ Factors sum but some have to be solved for graphically  
 ▶ (e.g. Delay and echo)

# Illustrating the VoIP Voice Quality Problem – Narrow Band Codecs (300Hz – 3,400Hz)

## ▶ TDM

- ▶ Lower latency
- ▶ generally low impairment, low latency codecs
- ▶ delivers generally satisfied international voice customers
- ▶ DCME example ▶

## ▶ Converting to VoIP

- ▶ packetisation latencies
- ▶ generally higher impairment, higher latency codecs,
- ▶ drives lower customer satisfaction ratings for equivalent calls
- ▶ e.g. G.729 ▶

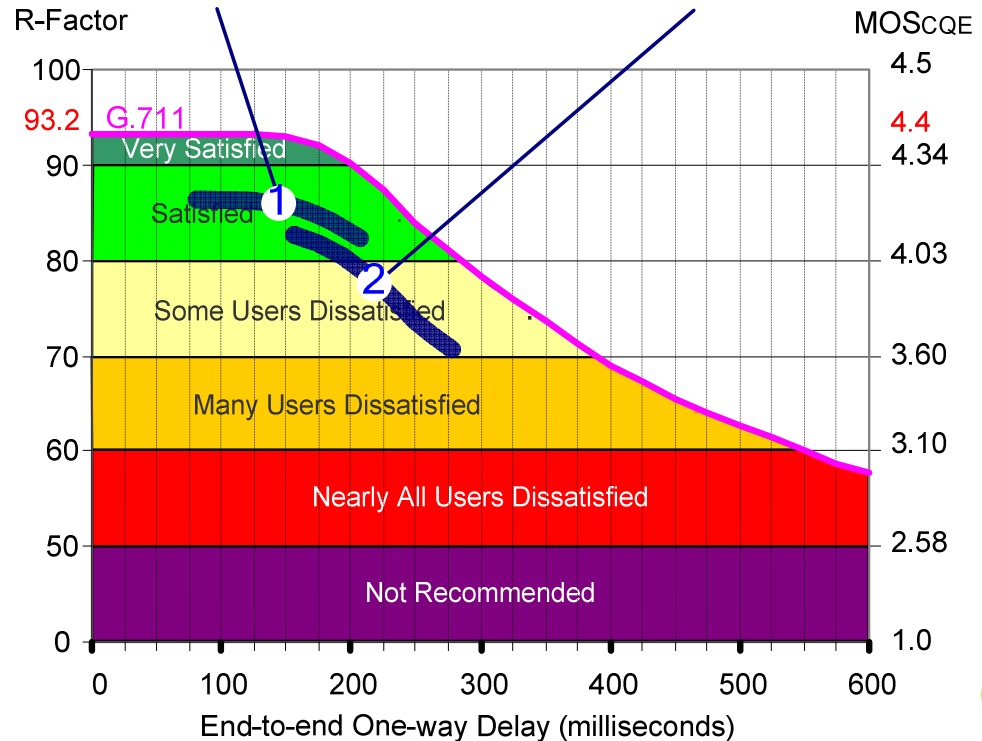

Typical TDM network international voice quality range for calls within a continent (left) to halfway around World (right)  
**(Current Voice Call Quality Range)**

DCME, G.726 or G.728

Typical IP based voice network international voice quality range for calls within a continent (left) to halfway around World (right)  
**(Future Voice Call Quality Range)**

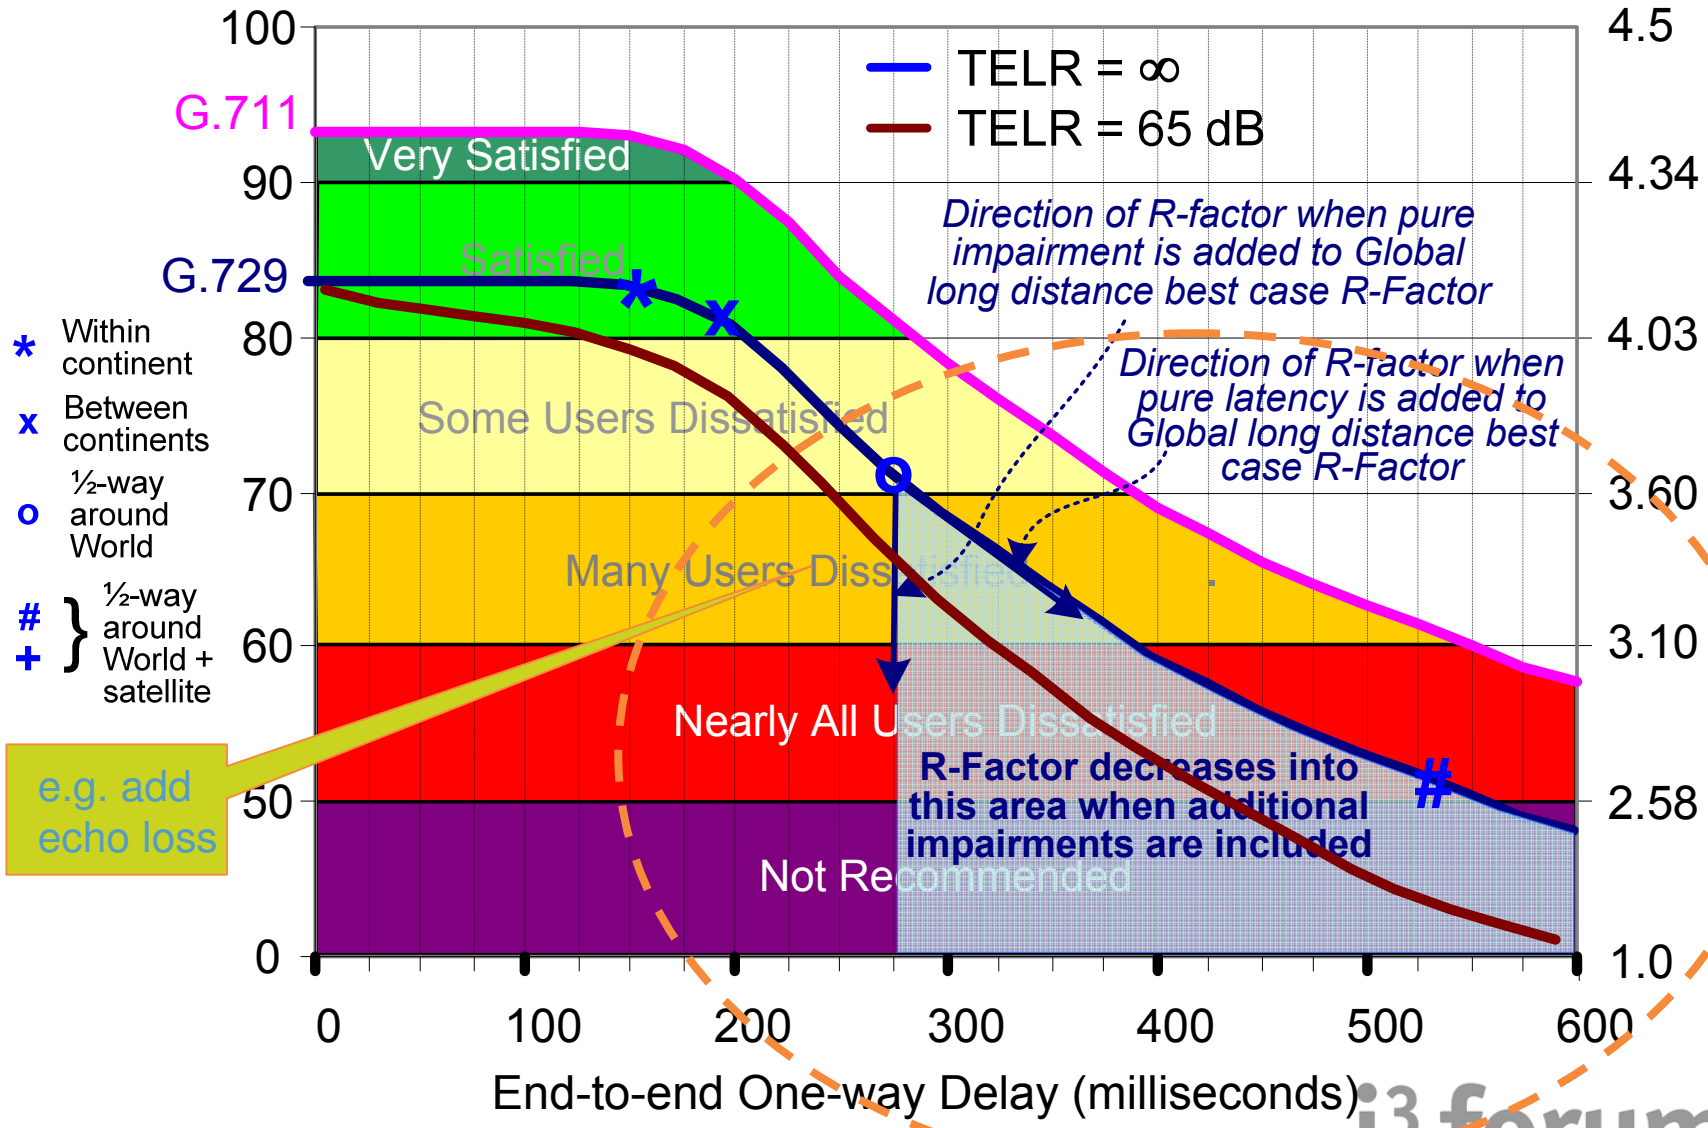

G.729

# Lower Tolerance for Additional Impairments

$$R\text{-Factor} = R_o - I_s - I_d - I_e + A$$

MOS<sub>CQE</sub>

# It Gets Worse Yet – Transcoding due to differing Codec Choices

## Narrow Band Codecs (300Hz – 3,400Hz)

- ▶ 3 examples
- ▶ NB: codec impairments ONLY are shown
- ▶ See White Paper for full explanations ([http://www.i3forum.org/sites/default/files/i3F%20-%20Technical%20White%20Paper%20on%20Codec%20Release%20%20\(2010-May\).pdf](http://www.i3forum.org/sites/default/files/i3F%20-%20Technical%20White%20Paper%20on%20Codec%20Release%20%20(2010-May).pdf))

- \* Within continent
- x Between continents
- o 1/2-way around World
- # } 1/2-way around World + satellite
- + } 1/2-way around World + satellite

# Wide Band Codecs - Help is on the Horizon

Deep Voices    Crisp Sound

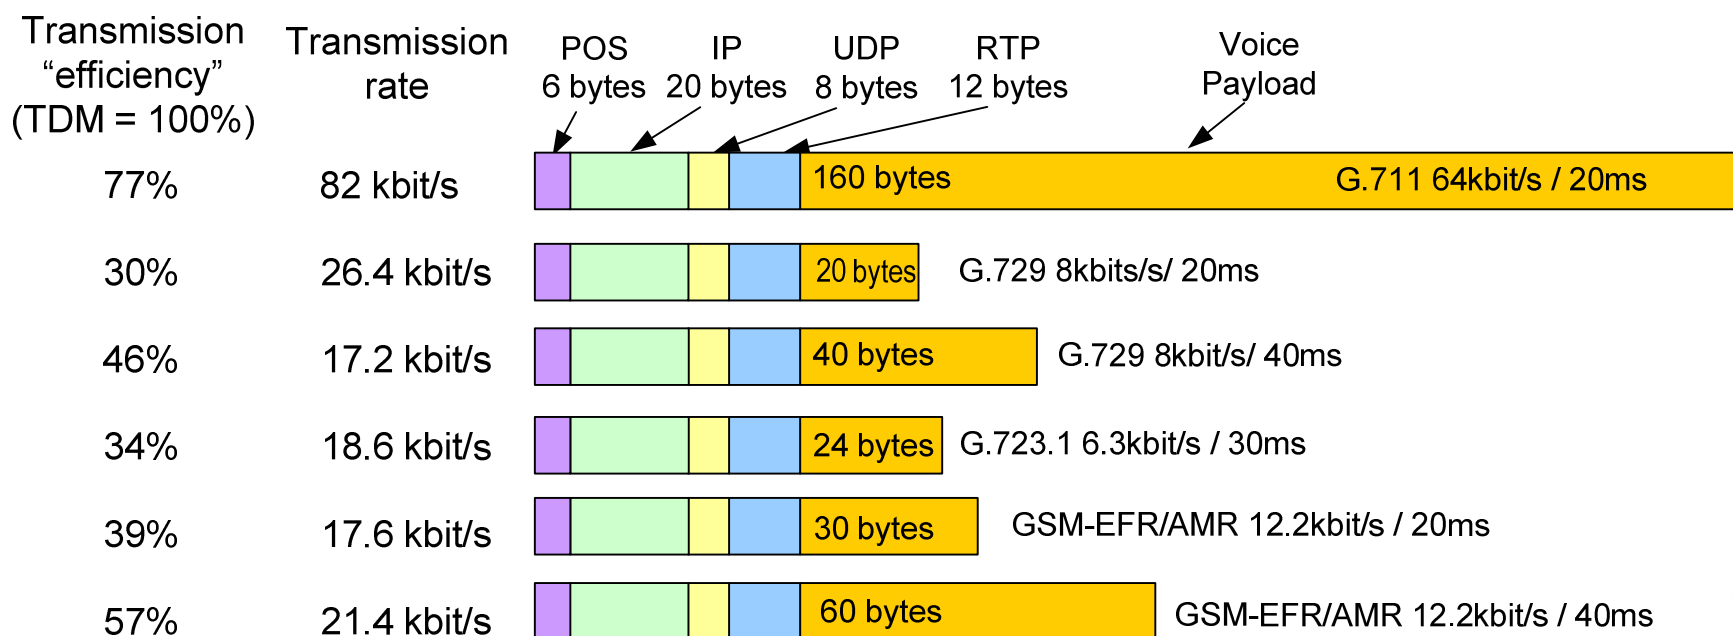

- ▶ Wideband Codecs ( 50Hz – 7,000Hz)
  - ▶ more natural sound
  - ▶ greatly improved sensation of presence
  - ▶ better intelligibility
  - ▶ superior listening comfort.
- ▶ Improved speech quality offsets the transcoding problems with NB transmission
- ▶ BUT as yet NO E-model available to predict wideband voice call quality overall, apart from
  - ▶ wideband codec impairments characterised *le,wb*
  - ▶ R-factor scale extended to R = 129
  - ▶ CANNOT mix NB *le* values in
  - ▶ no noise, echo effects etc can yet be modelled

## Wide Band Codecs – When Will They Help ?

- ▶ Wideband codecs are
  - ▶ new to voice telecommunications,
  - ▶ will be introduced by SP's when they deem necessary,
  - ▶ are required end-to-end
  - ▶ BUT improve international call quality considerably
- ▶ Universal use end-to-end seems a few years away yet.....

# Low Bit Rate Codecs – Packet Transmission Overheads

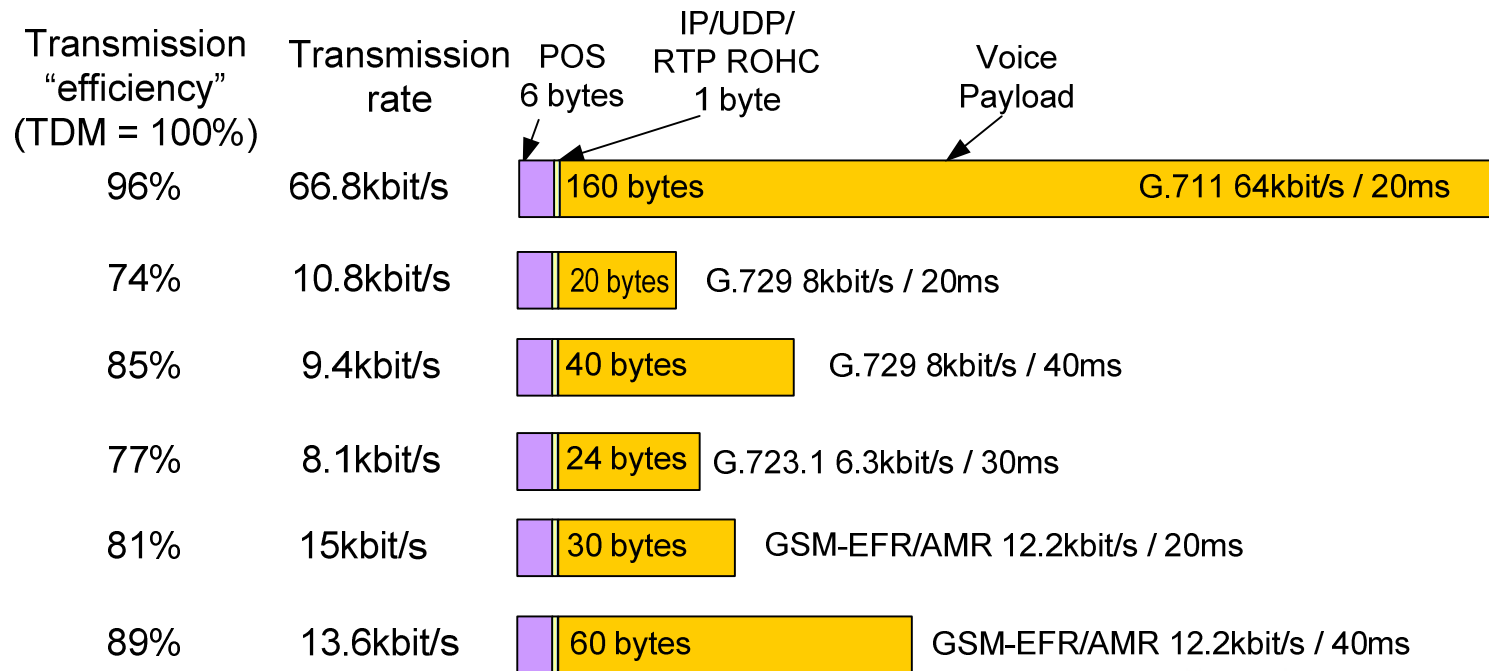

- ▶ LBR codecs (narrow band codecs with Low Bit Rate)
  - ▶ low transmission rates are required when bandwidth is scarce or expensive.
  - ▶ packet overheads increase transmission rate (cost) but do not contribute to voice quality
  - ▶ reducing voice payload size to accommodate packet overheads reduces voice quality (NOT a recommended design approach)

# Low Bandwidth Codecs – Packet Transmission Overheads reduced by IP/UDP/RTP compression

- ▶ IP/UDP/RTP headers total 40 bytes
- ▶ IP/UDP/RTP compression
  - ▶ RFC 2508 reduces this to 2 bytes,
  - ▶ RFC 3095 Robust Header Compression (ROHC) reduces this to 1 byte
- ▶ Implementable only on a single hop

# Low Bandwidth Codecs – Voice Transmission Overheads reduced by not transmitting silence

- ▶ Voice conversations have silent periods (while listening)
- ▶ Why transmit silences?
  - ▶ fill the gaps with “comfort noise”
    - ▶ comfort noise is generated by dynamic reconstruction of background noise from transmission of very low bandwidth noise characterisation signal
  - ▶ called Voice Activity Detection /Discontinuous Transmission (VAD/DTX)
  - ▶ saves Bandwidth with trivial quality impact
- ▶ Typical speech activity factors of 50% are obtained with normal speech, approximately halving the transmission bandwidth

# Low Bandwidth Codecs – Transmission bandwidth

## Bandwidth comparisons

Codec and DCME characteristics	Bandwidth per voice channel on SDH bearer (kbit/s)				
	TDM	VoIP			
		No IP/UDP/RTP compression		With IP/UDP/RTP compression	
		no VAD/DTX	with VAD/DTX*	no VAD/DTX*	with VAD/DTX*
<b>G.711 64kbps</b>	<b>64</b>	N/A	N/A	N/A	N/A
<b>DCME, G.726 32kbps + VAD/DTX*</b>	<b>16</b>	N/A	N/A	N/A	N/A

# Low Bandwidth Codecs – Transmission Cost

## Cost Comparisons

Monthly cost of voice channel on SDH bearer (USD) based on INTELSAT Std B antenna, Global Beam, 2Mbit/s IDR with 3/4 FEC, 5yr tariff					
Codec and DCME characteristics	TDM	VoIP			
		No IP/UDP/RTP compression		With IP/UDP/RTP compression	
		no VAD/DTX	with VAD/DTX*	no VAD/DTX	with VAD/DTX*
<b>G.711 64kbps</b>	<b>\$630</b>	N/A		N/A	N/A
<b>DCME, G.726 32kbps + VAD/DTX*</b>	<b>\$157</b>	N/A		N/A	N/A
<b>DCME, G.728 16kbps+ VAD/DTX*</b>	<b>\$79</b>	N/A		N/A	N/A
<b>Codec and Packetisation Period</b>					
<b>G.711 64kbps / 20ms</b>	N/A	<b>\$807</b>	<b>\$423</b>	<b>\$657</b>	<b>\$338</b>
<b>G.729 8kbps / 20ms</b>	N/A	<b>\$260</b>	<b>\$148</b>	<b>\$106</b>	<b>\$63</b>
<b>G.729 8kbps / 40ms</b>	N/A	<b>\$169</b>	<b>\$108</b>	<b>\$92</b>	<b>\$55</b>
<b>G.723.1 6.3kbit/s / 30ms</b>	N/A	<b>\$183</b>	<b>\$113</b>	<b>\$80</b>	<b>\$49</b>
<b>AMR 12.2kbit/s / 20ms</b>	N/A	<b>\$305</b>	<b>\$173</b>	<b>\$148</b>	<b>\$83</b>
<b>AMR 12.2kbit/s / 40ms</b>	N/A	<b>\$210</b>	<b>\$128</b>	<b>\$134</b>	<b>\$75</b>

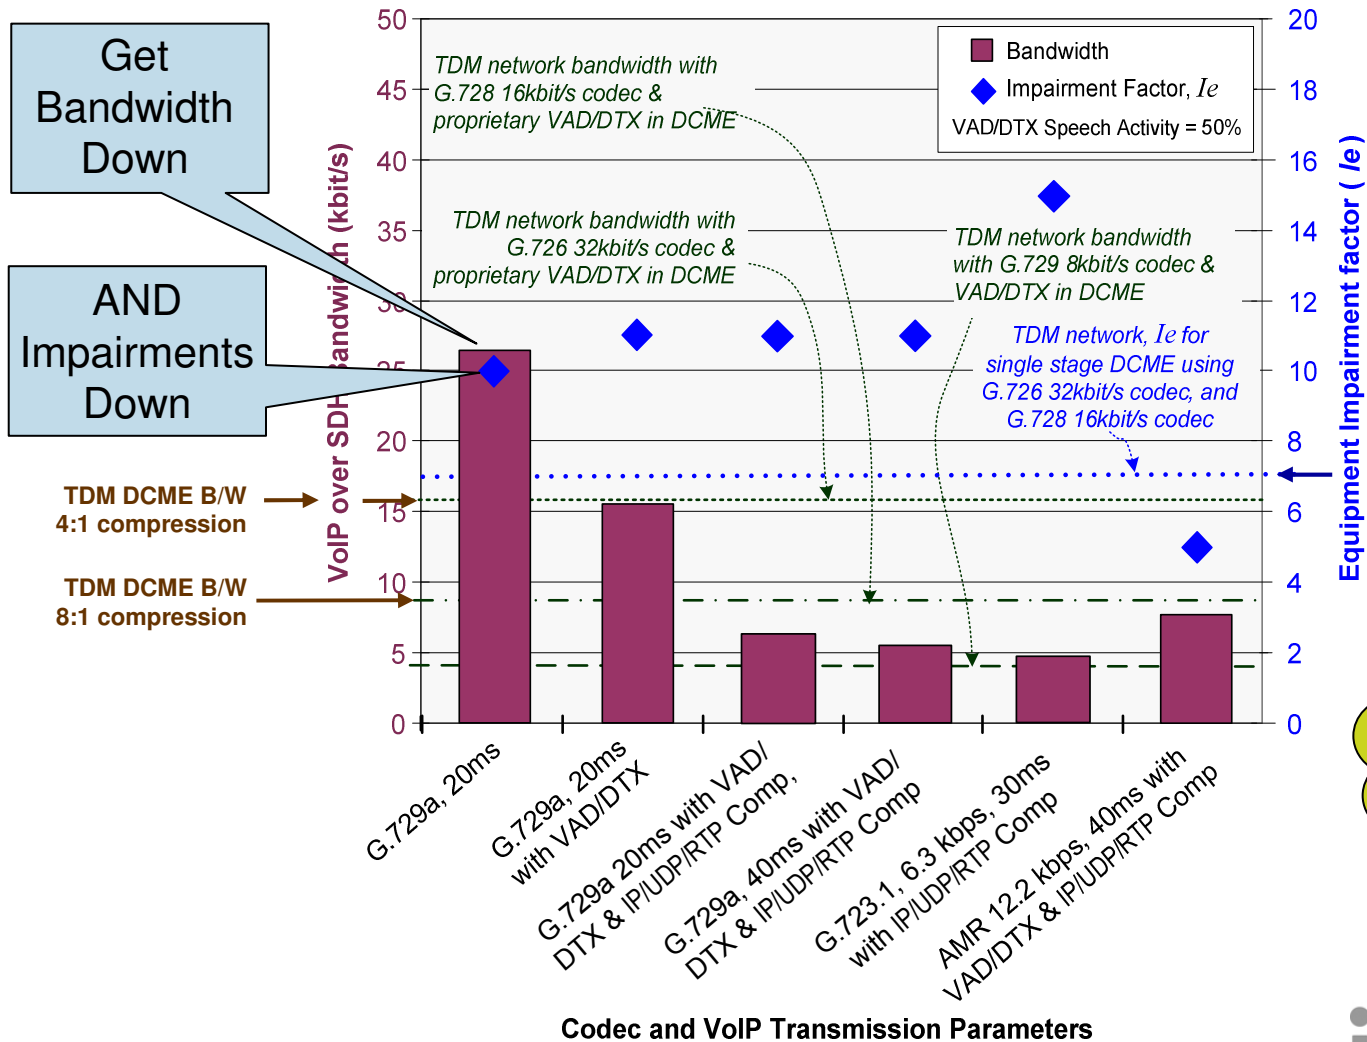

\*50% Speech Activity assumed

Finance Depts are used to these numbers

It is possible to engineer VoIP with similar costs

# Low Bandwidth Codecs – Voice Call Quality/Bandwidth Tradeoff

Select LBR codec and transmission parameters with regard to end-end quality

Bandwidth & Impairment interact

Choose codec from end-to-end considerations

# Conclusions

- ▶ Narrow Band VoIP networks will provide lower quality international voice calls than TDM networks
- ▶ quality (all-cable) network calls to fall from “*Users Satisfied*” (regardless of international distance) to
  - ▶ intra region (e.g. Europe)
    - ▶ “*Users Satisfied*” without transcoding
    - ▶ “*Some/Many Users Dissatisfied*” with transcoding
  - ▶ long international calls such as New Zealand/Australia to UK/Europe
    - ▶ “*Some/Many Users Dissatisfied*” without transcoding
    - ▶ “*Nearly All Users Dissatisfied*” with transcoding
- ▶ end-to-end planning required -
  - ▶ direct bilateral interconnections will offer more predictable quality
  - ▶ multiple downstream networks will generally present quality difficulty
- ▶ Longer term, wideband codecs
  - ▶ potentially compensate for quality lost in transcoding
  - ▶ their introduction by SP’s should be encouraged

# Codec and Transmission Choices

- ▶ select codecs with low algorithmic latency.
- ▶ choose shorter packetisation periods
- ▶ keep packet loss as low as possible (< 0,1%)
- ▶ use Packet Loss Concealment whenever possible
- ▶ Avoid G.723.1 codec
- ▶ G.729 codec family offers a good balance of latency, bandwidth (cost) and voice quality
- ▶ Using the AMR codec in fixed networks would eliminate some transcoding impairments between fixed and mobile networks when serving Mobile SP's
- ▶ where occupied bandwidth is a critical cost parameter (satellite transmission)
  - ▶ select codecs with low bit rate and low  $le$  (balancing cost and voice quality end-to-end),
  - ▶ use Voice Activity Detection and Discontinuous Transmission (VAD/DTX),
  - ▶ consider translating packetisation period to higher values, such as 40ms,
  - ▶ implement IP/UDP/RTP compression

# Transcoding

- ▶ Transcoding should be avoided unless absolutely necessary
- ▶ Many carriers end-to-end are likely to result in transcoding,
  - ▶ May render call quality completely unacceptable
  - ▶ Or even unintelligible
- ▶ Cooperation of all carriers and Service Providers in the call path will help maintain voice quality
- ▶ International Carriers should NOT transcode to save costs,
  - ▶ honour SP's codec choice where possible
  - ▶ different call Bandwidths could be tariffed differently
  - ▶ Satellite appears the exception where LBR codecs (PLUS other transmission techniques) appear necessary to justify costs
- ▶ Carrier/SP/Vendor cooperation is needed to achieve voice quality

**Thank you!**
