***Fax over IP:  
achieving an industry solution***

**Jerzy Słodrowski**  
*Network Architect*  
*Telekomunikacja Polska S.A.*

**i3 forum Technical Workshop**  
**Warsaw, 15–16 June, 2010**

international ip interconnection

**i<sup>3</sup> forum** 

# The problem

**In PSTN fax is widely used and works reliable but when there is an IP segment in connection chain:**

***„It takes weeks or even months to „tune” the networks before fax works.”***

What happens

- ▶ Fax connections cannot be setup
- ▶ Signalling is OK. connection setup – no data transfer
- ▶ Connections disconnected before transmission is completed
- ▶ Many redials or retransmissions
- ▶ Image errors

# i3 forum FoIP activity objectives

## Issue the guidelines for carriers to run reliable fax over IP without „tuning”

### **The necessity:**

„Fax should die in IP networks” however:

- ▶ Most regulation authorities consider fax as Universal Service.
- ▶ Fax is still used by customers.
- ▶ Fax is considered as legal document.

### **The activities:**

- ▶ September 2009 i3 forum started FoIP activity.
- ▶ January 2010 i3 forum started working with SIP Forum FoIP Task Group.

# What happens in IP segment

**In PSTN voice call is setup, then modem uses acoustic frequency to transmit image data (always G.711) :**

- ✓ T.30 for signalling
- ✓ T.4 or T.6 for image transmission

**In IP segment initially always voice call is setup, then after fax discrimination switchover is necessary:**

Digitalization of  
modem signal

**Fax passthrough (VBD)**  
**G.711 no VAD/DTX**

- ▶ Bandwidth requirements
- ▶ Packet loss,
- ▶ Jitter,
- ▶ Echo cancellation

Detection of fax signals,  
relay protocol use

**Fax relay**  
**ITU-T T.38**

- ▶ Ambiguous standard,
- ▶ Call parameters,
- ▶ Protocol interaction
- ▶ Delays - protocol timers

# Surveys and their results # 1

## Faults per connection chain section

- ▶ Between gateways, between gateway and terminal
- ▶ Incoming from SP VoIP networks

## Faults in subsequent fax call phases – interaction of protocols

## Most often mentioned problems:

- ▶ Disconnection on wrong SIP error codes when T.38 not supported.
- ▶ Call setup, T.38 ports opened, „no signal”
- ▶ Lack of VBD support
- ▶ Lack of V.34 support

# Standardization situation ITU-T.38

June 1998	32 p.	4 Amendments 1. H.323 setup. 2 SIP/SDP H.248 setup 3. IAF, TPKT 4. Improvements
March 2002	78 p.	3 Amendments <b>1. Half duplex V.34</b> , V.150.1 Internetworking Annex F, <b>Autonomous switchover</b> 2. RTP encapsulation 3. Implementation guidelines
April 2004	122 p.	Consolidation 1 Amendment, Addition of Vendor ID in SIP/SDP call setup
Sept. 2005	125 p.	Revision, precise specification
April 2007	129 p.	Revision, precise specification
July 2010	153 p.	Revised SIP/SDP O/A [SDPCapNeg and MediaCapNeg], New parameter: T38ModemType, Signalled and provisioned T.38 protocol parameters (Annex H)

International ip interconnection

# Surveys and their results # 2

## What can be neglected in this phase

- Cisco protocol and switchover
- Encryption – so far rarely used

## What is not possible

- Modem relay – V.150.1 not implemented.
- SSE switchover – no Annex F T.38

# Conclusions - i3 forum guidelines

General prerequisites

Bandwidth calculation, VBD definition, redundancy use, QoS parameters, packet loss, jitter, delay, COS marking, gateway resources configuration, echo control, transport stack recommendation

Technical guidelines for existing networks

**Only T.38 version 1998 can be used**

**How to improve interoperability in existing networks?**

Testing recommendations

- ▶ Always use RFC 2833 payload for fax tones
- ▶ Automatic speedup on fax tones – no V.152
- ▶ Implement G.711 without VAD/DTX
- ▶ SG3 to G3 fallback procedure
- ▶ ECM to be negotiated by terminals

Target technical guidelines

New versions of standards:

T.38, revised SDP...

—

# Next planned activities

## Main activity streams:

- ▶ Target guidelines based on new standard versions (ITU, IETF)
- ▶ Testing in real environment with SIP Forum
- ▶ Gathering information about FoIP problems

## Why testing in real network?

### Protocol interaction problems (examples)

- ▶ Delay between the off-ramp/receiving gateway's 200OK to initial INVITE and the subsequent re-INVITE to T.38.
- ▶ Delayed audio channel suppression during T.38 switchover
- ▶ Delays can change and the faults may appear or not – identification problem
- ▶ Some faults may appear as a result of several different causes

# Next activities details

## Target Guidelines with new standard version.

- T.38 version July/2010
- draft-ietf-mmusic-sdp-capability-negotiation-13.txt
- draft-ietf-mmusic-sdp-media-capabilities-09.txt
- ITU-T V.152 Amendment
  - Annex B – Use of data signal detection and silence insertion in voiceband data,
  - Annex C - Use of V.21 preamble for echo canceller control in a V.152 gateway”. 03/2009
- draft-ietf-avt-dtls-srtp-07.txt.

## Verification tests list

- Tests to be performed before running new IP interconnection link
- Equipment and network tests (also call flows, SIP O/A)

## Testing with SIP Forum. .

- Identification of interoperability problems and solution verification.
- Investigation of time dependencies problems – protocol interactions etc.
- Delay distribution measurement in tandem networks.
- Determination of an impact of different parameters on successful fax connection rate

## FoIP problems repository

- „Knowledge database” gathering the description of known problems and solutions

# T.38 version number

## Amendment 1 (2003) + IETF draft

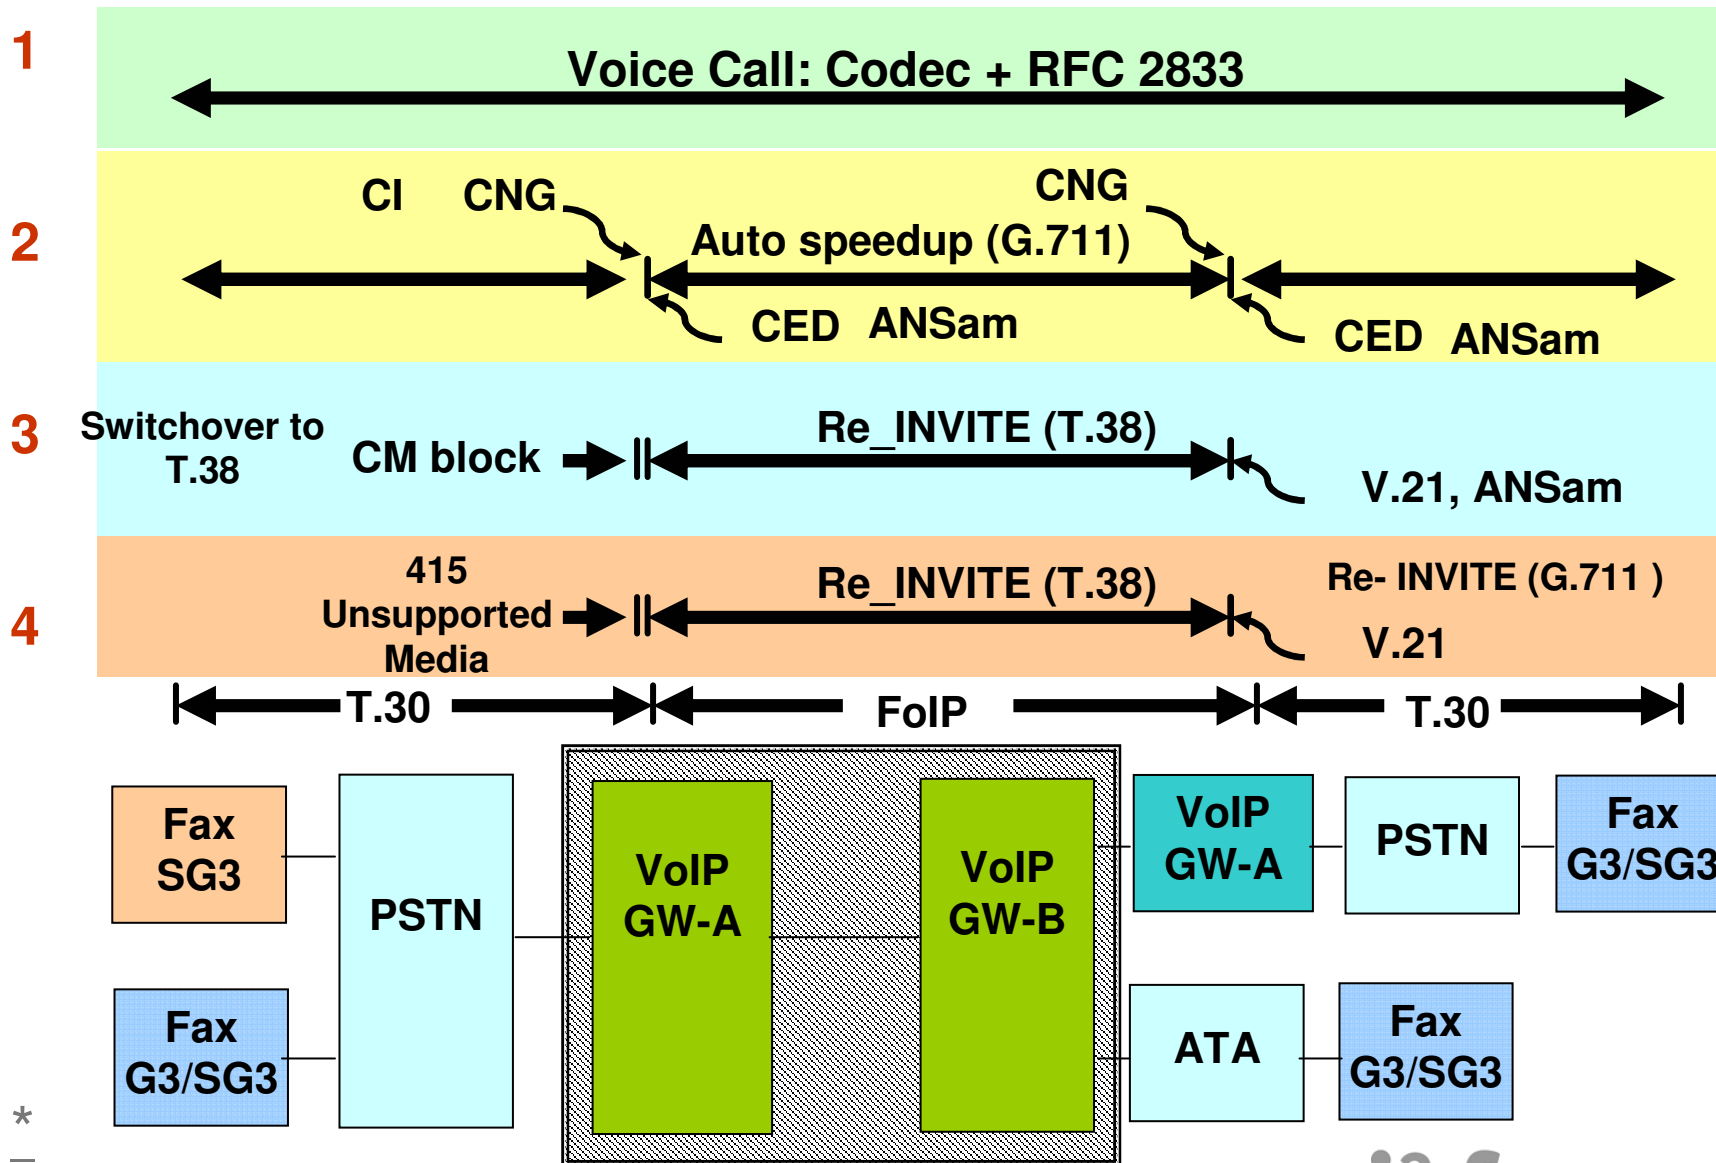

Version Number	Version Dependent Content Summary	Original Documentation
0	1998 ASN.1 Syntax	Initial Publication (1998), Amendment 1 (1999), Amendment 2 (02/00)
1	1998 ASN.1 Syntax, TPKT, IAF support	Amendment 3 (11/00) Note: Some early implementations supporting TPKT indicate version 0.
2	2002 ASN.1 Syntax	Updated Recommendation (2002)
3	V.34, V.33 support, 2002 Syntax extended	
4	Defined Defaults for negotiated parameters in Annex D.	Draft
